

CoachApp — Product Flow & Features

Audience: non-technical. This document explains *what the app does* and *how a user moves through it* — from login to the last step — for both the **Coach** and the **Trainee**. Use it to demo the product or explain it to a client.

1. What CoachApp is (in one paragraph)

CoachApp is an online platform that lets a ****fitness coach run their whole coaching business from one place, and lets each of their trainees follow their program from their phone****. The coach builds a library of exercises and foods, creates personalized workout and nutrition plans, assigns them to trainees, and follows each trainee's progress. The trainee logs in, sees exactly what to do and eat today, logs what they actually did, records their body measurements, and watches their progress over time. The coach and trainee are always looking at the same data from two sides.

2. The two kinds of users

	Coach	Trainee
Who they are	The professional running the program	The client being coached
What they do	Build & assign plans, manage clients, track results	Follow plans, log workouts/meals, track own progress
How many	One coach per workspace	Many trainees per coach
Account created by	Set up when the workspace is created	Created by the coach inside the app

Each coach gets a private, isolated workspace

Every coach operates in their **own separate workspace** (technically a "tenant"). One coach's trainees, exercises, foods, plans, and logs are **completely invisible to any other coach**. There is no shared pool — each coach's world is sealed off. A workspace has exactly **one coach** (the system actively prevents a second coach from being added to the same workspace) and as many trainees as the coach adds.

3. Signing in

Both coaches and trainees use the **same login screen** — a username and password. The system recognizes who they are and shows them the correct experience:

- A **coach** signs in and lands in the management experience (clients, plans, libraries, tracking).
- A **trainee** signs in and lands in their personal experience (today's plan, logging, progress).

How a trainee gets their login: the trainee does **not** sign themselves up. The ****coach** creates the trainee's account** inside the app (username + a starting password), then shares those credentials with the trainee. The coach can **reset a trainee's password** at any time, and can **deactivate** a trainee — a deactivated trainee can no longer sign in, but all their history is kept and they can be reactivated later.

4. The Coach's journey (login → last step)

Think of the coach's work in four stages: ****build the libraries → add clients → assign plans → track results.****

Stage 1 — Build the reusable libraries

Before assigning anything, the coach stocks two shared libraries that everything else is built from:

- **Exercise library** — each exercise has a name, the muscle group it targets, the equipment it

needs, plus optional description, instructions, and a photo/video link.

- **Food library** — each food has its nutrition facts for one serving (calories, protein, carbs,

fat) plus the serving size and unit (e.g. "100 g").

These libraries are reused everywhere, so the coach builds them once. If an exercise or food is already used inside a plan or a log, the app **won't let it be deleted** (to protect history) — the coach deactivates it instead so it stops appearing in new plans.

Stage 2 — Add trainees (clients)

The coach adds each trainee as a profile: name, contact info, gender, birth date, **training goal** (e.g. lose weight, build muscle, strength...), and starting numbers (height, start weight, target weight). Creating the trainee also **creates their login account** in one step. The coach can search and filter their client roster (by name, goal, active/inactive).

Stage 3 — Build & assign plans

The coach creates two kinds of plans for each trainee:

Workout plans — a plan is organized as **Plan** → **Days** → **Exercises**:

- The plan contains several training **days** (e.g. "Push Day", "Leg Day").
- Each day can be **scheduled to a weekday** (e.g. Leg Day = every Monday). This weekly schedule is

what drives the trainee's "Today" screen. A weekday with nothing scheduled is a **rest day**.

- Each exercise on a day carries the prescription: sets, reps, weight, rest, and notes.

Nutrition plans — organized as **Plan** → **Meals** → **Items**:

- The plan contains **meals** (e.g. "Breakfast", "Lunch").
- Each meal lists **food items** with a quantity (number of servings).
- The coach can set **daily targets** (calories, protein, carbs, fat) for the plan, or let the app

compute the target automatically from the meals.

Templates & reuse — the coach doesn't rebuild from scratch each time:

- The coach can save any workout or nutrition plan as a **reusable template**.
- The coach can **clone a template onto a trainee** to instantly create a personalized plan, then

tweak it.

Activating a plan: a trainee can have several plans on file, but ****only one active workout plan and one active nutrition plan at a time****. Activating a new plan automatically deactivates the previous one. The trainee only ever sees their **active** plans.

Stage 4 — Track results

Once a trainee is following their plans, the coach follows their progress:

- **Workout & nutrition logs** — the coach can view every session and every day of eating the

trainee has logged, filtered by date range.

- **Progress entries** — a dated timeline of body metrics: weight, body-fat %, and measurements

(chest, waist, hips, arm, thigh). The coach can record these at check-ins; the trainee can also record their own.

- **Dashboard analytics** — the coach sees computed stats per trainee:
- **Nutrition adherence** — how closely the trainee hit their calorie/macro targets, for a day or

across a range. Going over target stays visible (it's not hidden or capped at 100%).

- **Workout completion** — how many planned sessions the trainee actually completed over a period.
- **Notes** — the coach writes dated notes for a trainee (feedback, reminders). The trainee can read

the notes addressed to them.

5. The Trainee's journey (login → last step)

The trainee experience is designed around **one daily loop**: *open the app → see today → do it → log it → check progress.*

Step 1 — "Today" screen (the home screen)

When the trainee opens the app, the **Today** screen answers four questions at a glance:

1. **What do I train today?** — the workout day(s) scheduled for today's weekday, with every exercise and its prescribed sets/reps/weight. If nothing is scheduled today, it shows a ****rest day****.

1. **What do I eat today?** — today's nutrition plan with its meals and targets.
2. **How is today tracking?** — a live nutrition adherence readout for the day.
3. **Have I already logged it?** — whether a workout and/or a nutrition log already exists for today.

Step 2 — View the full plans

The trainee can open their **active workout plan** and **active nutrition plan** in full detail at any time — all days, all exercises, all meals. (Older, inactive plans are hidden from the trainee.)

Step 3 — Log the workout

When the trainee finishes training, they log it. Two ways:

- **Log this session (from the plan)** — one tap seeds a log from today's scheduled day. Every

prescribed exercise is pre-filled, so the trainee only adjusts what actually happened (e.g. they lifted more or fewer reps). The app **remembers what was prescribed vs what was actually done**, so the planned-vs-achieved comparison is preserved even if the coach edits the plan later.

- **Manual log** — the trainee logs a free-form session that isn't tied to a plan.

The trainee can edit a log afterward to fix the numbers.

Step 4 — Log the nutrition

Same idea for food:

- **Log from plan** — seeds today's log from the plan's meals, so the day starts pre-filled and the

trainee just adjusts.

- **Manual log** — the trainee logs foods and quantities freely.

As foods are logged, the app tallies calories and macros and compares them to the day's target.

Step 5 — Record progress

The trainee records **progress entries** — body weight, body-fat %, and measurements — on whatever dates they weigh/measure themselves. This builds their personal progress timeline. (The coach can also add entries; the trainee can see the coach's entries but can only edit or delete the ones they recorded themselves.)

Step 6 — Check the stats (My Dashboard)

The trainee sees their own analytics:

- **Nutrition adherence** — how close they are to their calorie/macro targets today, and their

weekly average (measured only across the days they actually logged, so a missed day doesn't unfairly crush the number).

- **Workout completion** — how many planned sessions they completed this period vs how many were

planned.

Step 7 — Profile & coach notes

- The trainee can read the **notes** their coach wrote for them.
- The trainee can update a **limited** part of their profile — phone, email, birth date. Everything

the coach owns (their goal, target weight, plan assignments, active status, and login name) stays under the coach's control.

6. Feature summary

Coach can...

Area	Capability
Clients	Add trainees (creates their login), edit, deactivate/reactivate, reset password, search/filter roster
Exercise library	Full manage; deletion blocked while in use (deactivate instead)
Food library	Full manage (with per-serving nutrition); deletion blocked while in use

Area	Capability
Workout plans	Build Plan→Days→Exercises, schedule days to weekdays, set the active plan
Nutrition plans	Build Plan→Meals→Items, set daily macro targets, set the active plan
Templates	Save any plan as a reusable template; clone a template onto a trainee
Tracking	View trainee workout & nutrition logs by date range
Progress	Record & manage a trainee's body-metrics timeline
Dashboards	Per-trainee nutrition adherence & workout completion analytics
Notes	Write dated notes for a trainee

Trainee can...

Area	Capability
Today	See today's scheduled workout, today's nutrition plan, live adherence, and what's already logged
Plans	View their active workout & nutrition plans in full detail
Workout logs	Log from the plan (pre-filled) or manually; edit their logs
Nutrition logs	Log from the plan (pre-filled) or manually; edit their logs

Area	Capability
Progress	Record & manage their own body-metrics entries
Dashboard	See their own nutrition adherence & workout completion stats
Notes	Read notes their coach wrote for them
Profile	Update limited contact details (phone, email, birth date)

7. A day in the life (narrative)

The coach, Sunday evening. Sara logs in, opens her client Ahmed, and clones her "Hypertrophy Block A" workout template onto him. She schedules Push to Monday/Thursday, Pull to Tuesday/Friday, Legs to Wednesday/Saturday, and activates the plan. She clones her "2,400 kcal cut" nutrition template onto him too, confirms the targets, and activates it. She leaves a note: "Start light this week, focus on form."

The trainee, Monday morning. Ahmed opens the app. **Today** shows "Push Day" with his exercises and prescribed sets/reps, plus his meals and a calorie target. He trains, taps **Log this session**, adjusts a couple of weights, and saves. Through the day he logs his meals from the plan. In the evening he records his morning weight as a progress entry and checks **My Dashboard** — he's at 98% of his calorie target and 1/1 workouts done today.

The coach, Wednesday. Sara opens Ahmed's dashboard, sees his week's adherence and completion trending well, reviews his logged weights on his progress timeline, and adds a note for the next check-in. Same data, two sides.

8. Languages

The product ships with full **English and Arabic** support — all screens' labels, roles, and even error messages are translated in both languages, so it can be presented to Arabic- or English-speaking clients out of the box.
